

Programmable MC-4 Ignition Control PN 15-00-2530

Parts Included:

1 - MC-4	1 - Pro-Data+ Disk	5 - Ring Terminals	4 - Female Deutsch Terminals
4 - Mounting Screws	2 - 3 Amp Fuses	10 - Butt Splices	2 - Diodes
7 - Wire Ties	1 - Wire Harness	5 - Male Fastons	1 - 4" Heat Shrink
5 - Wire Caps	1 - Diode	5 - Female Fastons	

WARNING: During installation, disconnect the battery cables. When disconnecting the battery always remove the Negative cable first and install it last.

Note: Solid Core spark plug wires cannot be used with the MC-4 Ignition. We recommend only the MSD 8.5mm Super Conductor Wires. A 4-Cylinder Universal Kit is available as PN 20-00-3520.

OPERATION

DIGITAL OPERATION

The Programmable MC-4 uses a high speed RISC microcontroller to control the ignition's output while constantly analyzing the various inputs such as supply voltage, trigger signals and rpm. The high speed controller can make extremely quick compensations to the timing and rpm limits while maintaining accurate timing signals to within $\pm 0.1^\circ$ and ± 10 rpm. The circuits and controller of the MC-4 have been thoroughly debounced and suppressed to create protection against Electro Magnetic Interference (EMI).

Note: The MC-4 can be removed from power and still retain its programmed settings.

CAPACITIVE DISCHARGE

The MC-4 features a capacitive discharge ignition design. The majority of stock and aftermarket ignition systems are inductive ignitions. In an inductive ignition, the coil must store energy and step up the supplied voltage to maximum strength between each firing. At higher rpm, since there is less time to charge the coil to full capacity, the secondary voltage falls short of reaching its maximum energy level which results in a loss of power or a top end miss.

The MC-4 Ignition features a capacitor which is quickly charged to 490 - 505 volts and stores this energy until the ignition is triggered. With the CD design, the voltage sent to the coil is always at maximum power even at high rpm.

MULTIPLE SPARKS

The MC-4 produces full power multiple sparks for each firing of a plug. The number of multiple sparks that occur decreases as rpm increases, however the spark series always lasts for 20° of crankshaft rotation. Above 3,300 rpm there is simply not enough time to fire the spark plug more than once, so there is only one full power spark.

PROTECTION

The Programmable MC-4 has a built in reverse polarity protection circuit. This will protect the ignition in the event of wrong connections. It will also shut off for protection from a surge in power. The ignition will still operate once the surge or polarity is corrected.

LED INDICATOR

There is an LED that monitors the status of the Ignition. The LED will verify trigger inputs and will flash trouble codes such as a Code 2 for No Cam Sync or Code 3 for Low Battery supply voltage.

SHIFT COUNTING

The MC-4 uses state of the art computer circuitry to determine when a shift has occurred. This eliminates having to wire in separate external switches. The MC-4 will sense the normal rpm drop of the engine to determine that a shift has been made. The rpm drop is programmable so it can be matched to the specific engine combination being used. In addition the engine rpm has to increase by 200 rpm before the next gear can be selected to prevent double shifting.

CAMSHAFT SYNCHRONIZATION

This is used only in applications where the individual cylinder timing is going to be used. The 2-pin connector with a Light Blue and Light Green wire (Fig. 1) connects to a sensor that is used to synchronize or alert the Ignition as to when the number one cylinder is going to be triggered. With this information, the Ignition knows which cylinder is being fired allowing for the individual cylinder timing capabilities. A Universal Cam Sensor is available from FDP as PN 15-00-0520.

Note: This is an option & does not have to be used.

Note: One cylinder or two cylinder Non Waste Spark Systems Do Not require this sensor.

Figure 1 Cam Sync Kit

PROGRAMMABLE FEATURES

The Programmable MC-4 Ignition has many features that give you more control over your timing and rev limits. For more information on programming these features, consult the supplied Programming Instruction booklet, or see the Help menu in the Pro-Data+ Software.

OPTIONAL HAND HELD PROGRAMMER, PN 15-00-6500

The Hand Held Programmer (Fig. 2) allows you to select and program the different features of the Programmable MC-4 Ignition. The MC-4 does not need to be connected to the programmer in order to operate because the program values are stored in an erasable memory circuit in the Ignition Control. The Programmer only needs to be connected when you want to check or change programs or to monitor different operating parameters. It connects to the Ignition with a six foot harness with a molded 9-pin connector.

Figure 2

LAUNCH SELECTOR/SHIFT LIGHT WITH GEAR INDICATOR

This Module (Fig. 3), PN 15-00-6503, connects to the Ignition through the 9-pin harness and allows the driver an instant way to change the Launch Rev Limit settings. There are two rotary dials that control the launch rpm only and are adjustable from 3,000 – 12,500 in 100 rpm increments. There is also an LED that indicates communication and power from the MC-4 Ignition. A 2-pin connector allows operation of the ultra bright LED shift light when connected to the MC-4. Also, the launch wire is monitored on the Gear 1 LED.

PRO-DATA+ (INCLUDED)

MSD has a software package for your PC that allows you to create timing and rpm programs for this ignition. All of the adjustable parameters can be reviewed and set, then uploaded to the ignition. This software program is included to allow the upload and download of programs for the Ignition Control as well as monitoring and editing of all the Ignition's parameters. It will work with any PC running Windows '95, '98 or NT. More information is available in the Programming instructions. Visit our website to download the current version at www.factorydirectperf.com.

Figure 3

CYLINDER SELECTION

The Ignition default is for 4-cylinder operation. It can also be programmed for 1 and 2-cylinder operation in the CylCnt menu on the Hand Held Programmer, or through the MSD Pro-Data+ Software.

RPM FEATURES

3-STEP REV CONTROL

The Programmable MC-4 uses a unique "Smart Touch™" Circuitry that learns the exact firing distance from one cylinder to the next to ensure the rev limiters are the smoothest available. The Smart Touch™ rev limiter will learn the small difference between each cylinder as well as large differences such as the Harley engines.

You can set three different rev limits that can be used during the burnout, launch and as overrev protection. Each limit is adjustable in 100 rpm increments from 2,000 – 15,000.

The different stages are selected by the Light Blue and Dark Blue wires. When 12 volts are supplied to the Light Blue wire, the Burnout limit is activated. Twelve volts on the Dark Blue wire activates the Launch rev limit (as well as the Launch Retard value, resets to Gear 1 indicator and timing curve). When 12 volts are removed from both wires, the overrev limit is in effect.

Note: If both wires are activated at the same time, the Launch limit (Dark Blue) will override the Burnout value.

RPM ACTIVATED WINDOW SWITCH

This feature can be programmed to activate and deactivate a circuit at desired rpm points. This RPM Switch will supply a ground path to a circuit through the Purple/Blue wire and then remove it at the selected rpm. It is capable of handling 3 amps continuous.

SEQUENCED SHIFT LIGHT/GEAR SELECTOR

FDP offers a Shift Light/Gear Selector, PN 15-00-0560, that easily connects to the 2 - Pin connector of the MC-4 Ignition Control (Fig.3). Five different gear selected rpm points can be programmed to turn the shift light On from 2,000 – 15,000 rpm in 100 rpm increments. This feature can also be attached to an air shifter to automatically shift the bike. The Red/Green + 12V output wire is fused for 3 amp maximum fuse size.

TIMING FEATURES

Note: All retards will be added together to determine the final timing setting.

START RETARD

This program will retard the timing from cranking through 800 rpm. It is automatically enabled and is adjustable from 0°-25° of retard. This eases the load on the starter and prevents backfires. The retard will deactivate if the engine rpm drops below 500 rpm.

Note: The MC-4 must be used on engines with an electric starter.

TIMING COMPENSATION

This feature allows the MC-4 to compensate for inherent retard from the trigger pickups and coils. The default is 2°. This is recommended when using a complete FDP Ignition System. Most other applications will require between 2° - 3°.

MULTI-STAGE RETARD

This Ignition offers three stages of retard that can be activated at different times via three control wires and/or an rpm programmed value. Each retard is adjustable from 0°-15° in 0.1° increments (from 800-15,000 rpm). When used together the retard stages are added together. The total maximum amount of the retards is 25°.

Each stage is activated when 12 volts are supplied to the corresponding wire and the engine speed is above the rpm value. The retard value will remain active until 12 volts are removed from the wire, or the engine speed drops below the rpm value.

Pink Wire – Stage 1

Violet – Stage 2

Tan Wire – Stage 3

Step Retard Deactivation Delay: This program allows you to select a delay time when a stage of retard is deactivated. This is useful to ensure that nitrous has stopped flowing through the engine. The delay time can be set from 0 – 2.5 seconds.

STAGE 3 RETARD RAMP

The Stage 3 retard also has a timed ramp function for progressive nitrous applications. This time is programmable from .1 to 9.9 seconds. (Note: If this is set to zero the third stage functions exactly like stages 1 and 2.) If a value above zero time is entered then the third retard stage will progressively retard the timing over this time frame. The start point for the progressive retard can be activated by the release of the launch rev limiter, by rpm or by a separate external activation wire that can be connected to a timer or other devices.

LAUNCH RETARD TIMING CURVE

This program can be set from 800 – 15,000 rpm (Every 100 rpm) in steps as small as 0.1° up to 25°. It is rpm dependent. When 12 volts are applied to the Dark Blue wire this program is activated. It will override the Run Timing Program until the bike is shifted to second gear where the Run Timing Curve is activated and in for the duration of the run.

Note: All retards are added together when activated. If a stage of retard is activated at the same time as the Launch Retard or Launch Timing Curve, the programmed retards are added together. It is recommended to view the Retard Sum using the Handheld Programmer or the MSD Pro-Data+ Graph View.

LAUNCH RETARD RAMP

This feature allows the ignition timing to ramp back to the Launch Timing Curve over a programmable amount of time from 0 – 2.5 seconds in 0.010 second increments. The retard is programmable from 0° - 15° degrees in .5° increments. This Ramp time is activated when the 12 volts are removed from the Dark Blue (Launch Retard/Launch RPM) wire.

GEAR RETARDS

This feature allows you to program a different retard for each gear without any extra wiring. Once the shift sequence is reset with the Launch Control Wire (Dark Blue), the MC-4 will retard the timing automatically following each shift. Zero to 5° can be removed in each gear and the retards are cumulative, (example: 3° in 3rd, 3° in 4th and 4° in 5th, total 10°). The Launch Control Retard Curve allows 1st gear timing and 2nd gear uses the Run Retard Curve. Each additional shift can be programmed to have additional retards without the use of external switches.

RUN TIMING CURVE

This is the program for the full ignition timing curve from 800 – 15,000 rpm. The curve is adjustable in 0.1° increments every 100 rpm with 25° maximum. The Run Timing Curve is the default program and remains active at all times unless the Launch Timing Curve is activated at which point it is overridden until the first shift when the Launch Timing Curve is deactivated.

Note: The Run Timing Curve will be added to any Stage Retards and Gear Retards that are activated throughout the run. Maximum retard using the Run Curve is 25°.

INDIVIDUAL CYLINDER MANAGEMENT (ICM)

This program allows you to select a retard for each cylinder. Each cylinder can be programmed to have up to 5° of timing removed and is adjustable in 0.1° increments. This amount is added to any retard amount being used with the Run Curve or Step Retards.

To take advantage of the ICM, a Cam Sync Sensor must be incorporated. FDP offers a Universal Cam Sync Pickup, PN 15-00-0520. A Sync Sensor is necessary to alert the Ignition Control when the number one cylinder is being triggered. When the Ignition knows that the number one cylinder is firing, it starts the triggering sequence and uses the retard set for each cylinder at the correct time.

The Cam Sync pickup must be phased correctly with the crank trigger. It should be adjusted initially to lead the #1 cylinder by 5° - 10°. This will get it close enough to run the engine. You then need to center the sensor signal around the trigger pickup signal for correct operation over the entire rpm range of the engine. This is set by using the Pro - Data + or monitor mode on the Programming Unit. You can then move the Sync pickup until the monitor reads CamSync SYNC.

The Ignition monitors both ignition trigger and cam sync inputs for every revolution of the engine. Also, the LED will flash a code 2 (blink-pause-blink) and the Hand Held Programmer will read CamSync None or No CamSync if there is an error with the Cam Sync Pickup. For complete setup instructions see the Programming Instructions.

Note: On one cylinder applications a Cam Sync is not required. On two cylinder, no waste spark applications, a Cam Sync is not required.

SHIFT KILL

There are two input options for the shift kill feature.

Note: The supplied Diode may need to be used, if you are using the Yellow Kill Wire connected to the shift solenoid (See Fig. 9).

- If you are using a push button air shifter then the Yellow wire will be used and the three time - delayed kill modes will be available.
- If you are using the Shift Light output to automatically activate your air shifter, then you can select "ShiftLight" under the kill source feature. This will provide a kill as soon as the shift light outputs to the Airshifter. All the Shift Kill time delay modes are still available.

Note: The Yellow wire can still be used in this configuration for a manual kill.

- Shift Kill Delay - Programmable from 20 to 99 milliseconds in 1 millisecond intervals. This allows a delay from the time the shift kill is activated until the engine kill function turns off. This delay is essential to allow the transmission to make a complete shift.
- Shift Kill Modes - Three modes are available:
 1. Manual - This will provide a kill everytime the kill is activated.
 2. Auto 1,2 - This will ignore the first shift but provide a kill for every sequential shift thereafter.
 3. Auto 1,2,3 - This will ignore the first two shifts but provide a kill for every sequential shift thereafter.

OPTIONAL BOOST RETARD CURVE

The MC-4 has an external 3-pin connector (Fig. 4) that will attach to one of two optional Map Sensors PN 15-00-0532 (2 Bar) 2-29 psi or 15-00-0535 (3 Bar) 2-44 psi. When this sensor is used, a timing curve can be programmed into the MC-4 based on the pressure within the intake manifold. This is especially useful for turbo applications. This feature is programmable from 2 to 45 psi in 0.25 psi increments, from 0-25° retard in .1° increments.

Figure 4

WIRING FUNCTIONS

Power Leads		These are the two heavy 12 gauge wires and are responsible for getting direct battery voltage to the ignition. The Ignition is load protected from reverse battery connections and will automatically shut down if there is over 27 volts input.
Heavy Red		This wire connects directly to the battery positive (+) terminal or a positive battery junction such as the starter solenoid. Note: Do not connect to the alternator.
Heavy Black		This wire connects to a good ground, either at the battery negative (-) terminal or to the engine. Note: Engine must be grounded to battery negative.
Ignition Switch		
Red		This wire is responsible for turning the MC-4 On and Off as well as supplying power to the triggers. Connect to a switched 12 volt source such as the ignition key or switch. Also recommended for lanyards.
Coils		
Coil 1	Brown/Orange	This wire connects to the coil 1 positive (+) terminal. This is the ONLY wire that makes electrical contact with the positive coil terminal.
	Brown/White	This wire connects to the coil 1 negative (-) terminal. This is the ONLY wire that makes electrical contact with the negative coil terminal.
Coil 2	Brown/Orange	This wire connects to the coil 2 positive (+) terminal. This is the ONLY wire that makes electrical contact with the positive coil terminal.
	Brown/Green	This wire connects to the coil 2 negative (-) terminal. This is the ONLY wire that makes electrical contact with the negative coil terminal.
Trigger Pickups		
4 - Pin Connector	White/Blue	+ 12V to Trigger Pickups
	Black	Ground to Trigger Pickups
	White (Coil 1)	This wire is used to connect to breaker points or trigger pickups (Dyna* or MSD), electronic ignition amplifier output or to the trigger output of the ECU for coil 1. (*Single Magnet Rotor Only.)
	Green (Coil 2)	This wire is used to connect to breaker points or trigger pickups (Dyna* or MSD), electronic ignition amplifier output or to the trigger output of the ECU for coil 2. (*Single Magnet Rotor Only.)
2 - Pin Connector Cam Sync		
Lt Blue Lt Green		This 2-pin connector plugs into a Cam Sync Sensor to indicate when the number one cylinder is triggered.
Accessories		
3-Step Rev		
Light Blue		This wire activates the Burnout rev limit when 12 volts are applied.
Dark Blue		When 12 volts are applied, this wire activates several features including: Launch rev limit, Launch Retard value, Launch Timing Curve and will reset the Shift Light sequence to 1 st gear & Step 3 slope.
Tach Output		
Gray		Used to provide a tach signal to rpm sensing devices. 12 volt square wave with 30° duty cycle.

WIRING FUNCTIONS CONT.

3-Step Retard	
Pink	This wire activates the first retard stage when it is applied to 12 volts. When 12 volts are removed the retard is deactivated.
Violet	This wire activates the second retard stage when it is applied to 12 volts. When 12 volts are removed the retard is deactivated.
Tan	This wire activates the third retard stage when it is applied to 12 volts. When 12 volts are removed the retard is deactivated if ramp value = 0. Step 3 retard ramp can be activated by this wire providing a progressive retard ramp that is programmable from .1 to 9.9 seconds.
Shift Light/Shifter 2 Pin Connector	
Red/Green Yellow/Orange	Shift Light activation wire. Connects to the Shift Light PN 15-00-0560 or to any air shifter with a 3 amp or less current draw. A 3 amp fuse is in line on the Red/Green wire.
RPM Switch	
Purple/Blue	RPM Activation Switch. This wire will supply a ground to complete a circuit at a desired rpm. It will handle up to 3 amps continuous.
Map Sensor 3 Pin Connector	
Brown/Violet Brown/Yellow Dark Brown	Three Pin Connector - Used for an optional external pressure sensor for turbo applications. (2 - Bar/2-29 psi - 15-00-0532) (3 - Bar/2-44 psi - 15-00-0535).
Shift Kill	
Yellow	Used to activate the Shift Kill feature. Note: Do Not use for kill lanyard.

GENERAL INFORMATION

BATTERY

The MC-4 Ignition Control will operate on any negative ground, 12 volt electrical system. The MC-4 can be used with 16 volt batteries and can withstand a momentary 24 volts in case of jump starts. The MC-4 Ignition will deliver full voltage with a supply of 11- 18 volts and will operate momentarily with a supply voltage as low as seven volts.

If your application does not use an alternator, allow at least 15 amp/hour for every half hour of operation. The MC-4 uses about .7 Amps for every 1,000 rpm. If the engine is cranked with the same battery or other accessories such as an electric fuel or water pump are used, the amp/hour rating should be higher.

COILS

FDP Motorcycle Blaster Coils, PN 15-00-3030, are recommended with this ignition. Single or twin cylinder, single plug applications the 30-00-3005 Pro CD Coil is recommended. For more information on recommended coils, contact our Customer Support Department at (915) 858-3365.

TACHOMETERS

The MC-4 Ignition features a Tach Output Wire (Gray). This wire provides a trigger signal for tachometers, a shift light or other add-on rpm activated devices. The Tach Output Terminal produces a 12 volt square wave signal with a 30° duty cycle. Some vehicles with **factory tachometers/fuel pumps may require a Tach Adapter** to operate with the MC-4. For more information on Tachometers and Tach Adapters, see the Tachometer Section on page 8.

SPARK PLUGS AND WIRES

Spark plug wires are very important to the operation of your ignition system. A good quality, helically wound wire and proper routing are required to get the best performance from your ignition, such as the MSD 8.5mm Super Conductor Wire. Helically wound wires provide a good path for the spark to follow while keeping Electro Magnetic Interference (EMI) to a minimum. Excessive EMI, such as the amount that solid core wires produce, will interfere with the operation of the MC-4. **Solid Core spark plug wires cannot be used.** The PN 20-00-3520 is a 4 - Cyl. 8.5mm Wire Set.

Routing: Correct routing of the plug wires is also important to performance. Wires should be routed away from sharp edges and engine heat sources. If there are two wires that are next to each other in the engine's firing order, the wires should be routed away from each other to avoid inducing a spark into the other wire.

Spark Plugs: Choosing the correct spark plug design and heat range is important when trying to get the best performance possible. Since there are so many engine combinations and manufacturers, FDP cannot recommend which plug or gap is exactly right for your application.

It is recommended to follow the engine builder or manufacturer's specification for spark plugs. With that, you can then experiment with the plug gap to obtain the best performance. The gap of the plugs can be opened in 0.005" increments, then tested until the best performance is obtained.

Sealing: The MC-4 is potted completely with a polyurethane compound for vibration and water resistance.

Welding: If you are welding on your motorcycle, to avoid the chance of damage always disconnect all power and ground cables of the MC-4. (You should also disconnect the tach ground wire too).

MOUNTING

The MC-4 can be mounted in any location as long as it is away from direct engine heat sources. It is not recommended to mount the unit in an enclosed area.

GENERAL WIRING INFORMATION

Wire Length: All of the wires of the MC-4 Ignition may be shortened as long as quality connectors are used or soldered in place. To lengthen the wires, use one size bigger gauge wire (10 gauge for the power leads and 16 gauge for the other wires) with the proper connections. All connections must be sealed.

Grounds: A poor ground connection can cause many frustrating problems. When a wire is specified to go to ground, it should be connected to the battery negative terminal, engine block or chassis. There should always be a ground strap between the engine and the chassis. Always securely connect the ground wire to a clean, paint free metal surface.

Routing Wires: The MC-4 wires should be routed away from direct heat sources such as exhaust manifolds and headers and any sharp edges. The trigger wires should be routed separate from the other wires and spark plug wires. It is best if they are routed along a ground plane such as the block or frame.

PRESTART CHECK LIST

- The only wires connected to the coil terminals are the MC-4 wires to coil positive and coil negative.
- The small Red wire of the MC-4 is connected to a switched 12 volt source and, if used, the lanyard is installed.
- Confirm the cylinder select is in the proper position for your application.
- The power leads are connected directly to the battery positive and negative terminals.
- The battery is fully charged.
- The engine is equipped with at least one ground strap to the chassis.

TROUBLESHOOTING

Every FDP Ignition undergoes numerous quality control checks including a four hour burn-in test. If you experience a problem with your MC-4, our research has shown that the majority of problems are due to improper installation or poor connections. The Troubleshooting section has several checks and tests you can perform to ensure proper installation and operation of the MC-4. If you have any questions concerning your MC-4, call our Customer Support Department at (915) 858-3365, 8-5 Mountain Time, or e-mail at: tech@factorydirectperf.com.

LED

The LED on the side of the MC-4 monitors several operating conditions of the MC-4. If the LED indicates that there is a problem with the ignition system, follow the steps through the Troubleshooting section. The LED will appear to be on steady at above idle speeds when everything is functioning properly.

- A Code 2 (flash flash) will flash if there is a problem with the Cam Sync Signal.
- A Code 3 (flash flash flash) will flash if the supply voltage drops below 12 volts, when operating below 3300 rpm.
- The LED will flash for every trigger signal from the crank trigger. You can take advantage of this when statically setting the timing of the engine.

TACH/FUEL ADAPTERS

If your tachometer does not operate correctly you probably need a Tach Adapter. The chart in Figure 5 lists common tachometers and if an Adapter is necessary.

Tachometer Compatibility List	
AFTERMARKET TACHOMETER	WHITE WIRE TRIGGER
AUTOGAGE	REQUIRED
AUTOMETER	NO TACH ADAPT REQUIRED
MALLORY	NO TACH ADAPT REQUIRED
MOROSO	NO TACH ADAPT REQUIRED
STEWART	REQUIRED
S.W. & BI TORX	REQUIRED
SUN	REQUIRED
VDO	REQUIRED

Figure 5 Common Tachometers and Adapters.

MISSES AND INTERMITTENT PROBLEMS

Experience at the races has shown that if your engine is experiencing a miss or hesitation at higher rpm, it is usually not directly ignition. Most probable causes include faulty wiring, a coil or plug wire failure, arcing from the boot plug to ground. Several items to inspect are:

WARNING: Do not touch the coil terminals during cranking or while the engine is running.

- Always inspect the plug wires at the plug for a tight connection and visually inspect for cuts, abrasions or burns. Dielectric grease such as Spark Guard, PN00-00-0550, is also recommended.
- Inspect the Primary Coil Wire connections. **Caution:** There may be high voltage at the Coil Positive (+) terminal even with the key turned On. During cranking or while the engine is running, very high voltage will be present and no test equipment should be connected.
- Make sure that the battery is fully charged and the connections are clean and tight. If you are not running an alternator this is an imperative check. If the battery voltage falls below 11 volts during a race, the MC-4 current draw will increase.
- Is the engine running lean? Inspect the spark plugs and complete fuel system.
- Inspect all wiring connections for corrosion or damage. Remember to always use proper connections followed by soldering and seal the connections completely.
- If you are using the Yellow Shift Kill Wire with a Shift Solenoid, you may be getting a double kill when shifting. Attach the supplied Diode to the solenoid as shown in Figure 9.

If everything checks positive, use the following procedure to test the ignition for spark.

FDP also offers an Ignition Tester (Fig. 6), PN 15-00-1505. This tool allows you to check your complete ignition system while it is on the bike as well as the operation of rpm limits, activated switches and shift lights and the Cam Sync Signal.

CHECKING FOR SPARK

1. Make sure the ignition switch is in the "Off" position.
2. Remove the coil wires from the spark plug and set them approximately 1/2" from ground.
3. Disconnect the MC-4 wire from the points or trigger.
4. Connect the Green wire to ground.
5. Turn the ignition to the On position. Do not crank the engine.
6. Tap the white wire to ground quickly several times (Figure 7). Each time you pull the wires from ground, a spark should jump from the coil wires to ground. If spark is present, the ignition is working properly. Do the same test using the Green Trigger wire. If there is no spark skip to step 7 below:
7. If there is no spark:
 - A. Inspect all of the wiring.
 - B. Substitute another coil and repeat the test. If there is now spark, the coil is at fault.
 - C. If there is still no spark, check to make sure there are 12 volts on the small Red wire from the MC-4 when the key is in the On position. If 12 volts are not present, find another switched 12 volt source and repeat the test.
 - D. If, after following the test procedures and inspecting all of the wiring, there is still no spark, the MC-4 Ignition is in need of repair. See the Warranty and Service section for information.

Service

In case of malfunction, this component will be repaired free of charge according to the terms of the warranty. When returning components for service, Proof of Purchase must be supplied for warranty verification. After the warranty period has expired, repair service is charged based on a minimum and maximum charge.

Send the unit prepaid with proof of purchase to the attention of: **Customer Service Department, Factory Direct Performance, 1355 Pullman Dr., El Paso Texas 79936.**

When returning the unit for repair, leave all wires at the length in which you have them installed. Be sure to include a detailed account of any problems experienced, and what components and accessories are installed on the vehicle.

The repaired unit will be returned as soon as possible after receipt, COD/Cashiers Check for any charges. For more information, call the FDP Customer Service Line **(915) 858-3365**. FDP technicians are available from 8:00 a.m. to 5:00 p.m. Monday - Friday (Mountain Time).

Limited Warranty

Factory Direct Performance warrants this product to be free from defects in material and workmanship under its intended normal use* and if properly installed, for a period of one year from the date of original purchase. If found to be defective as mentioned above, it will be repaired or replaced at the option of Factory Direct Performance. Any item that is covered under this warranty will be returned free of charge through standard shipping methods. If faster service is required the customer has the option of paying for this service.

This shall constitute the sole remedy of the purchaser and the sole liability of Factory Direct Performance. To the extent permitted by law, the foregoing is exclusive and in lieu of all other warranties or representations whether expressed or implied, including any implied warranty of merchantability or fitness. In no event shall Factory Direct Performance or its suppliers be liable for special or consequential damages.

*Intended normal use means that this item is being used as was originally intended and for the original application as sold by Factory Direct Performance. Any modifications to this item or if it is used on an application other than what Factory Direct Performance markets the product, the warranty will be void. It is the sole responsibility of the customer to determine that this item will work for the application they are intending. Factory Direct Performance will accept no liability for custom applications.
